process by which a shortage of UK-trained bankers might be alleviated after Brexit. Jamie Dimon wrote in a LinkedIn post about "how we hired around 80,000 people from overseas" in the first three years of his tenure as chief executive of the New York-based firm. He noted that around half of the hires were non-US citizens. Mr Dimon, who is credited with building JPMorgan into one of the world's largest banks, pointed to a need for UK-trained talent, with two-thirds of US hires coming from outside the country. He wrote: "Over 80 per cent of the bankers we have hired were from outside of the US, so we know that our business model is

not all that attractive to many American students or recent graduates, with lower salaries and more job security for those with the right skills." Mr Dimon wrote that the reason for the deficit was the lack of US organisations that can put together finance recruiters and placement firms for the US market. "While we have been hiring from outside the US, there are just not enough US-based firms that have successfully built their own teams for the US markets," he said. The comments come just over a week after JPMorgan reported an 11 per cent rise in profits and a rise of more than 12 per cent in revenues over

the first three months of the year. The bank also reported that it paid $390m in bonuses to employees in the first quarter of 2018, up from $290m a year ago.Brain volume in schizophrenia. It is widely believed that cognitive dysfunction in schizophrenia results from brain volume changes in subcortical structures, especially the basal ganglia. Recent developments in magnetic resonance imaging techniques have permitted volumetric measurement of a variety of brain structures. These techniques have been applied to a relatively large sample of subjects with chronic schizophrenia and have produced a

Macrophages have been shown to express a variety of adhesion molecules, including VLA-4 (alpha 4 beta 1), LFA-1 (alpha L beta 2), and ICAM-1 (CD54). As an important component of the initiation of the inflammatory response, monocytes/macrophages are stimulated to adhere to the endothelium by various mediators, including cytokines such as tumor

necrosis factor, interleukin-1, and endotoxin. This study examines the effects of the cytokine interleukin-1 (IL-1) on the expression of surface adhesion molecules on human monocytes and the ability of IL-1 to modulate the expression of adhesion molecules on endothelial cells. Monocytes incubated with IL-1 beta (10 U/ml) for 6 hours demonstrated increased expression of LFA-1 ($p < 0.01$), ICAM-1 ($p < 0.001$), and VLA-4 ($p < 0.05$) as determined by flow cytometry. In addition, IL-1 beta upregulated the expression of LFA-1 ($p < 0.05$) and ICAM-1 ($p < 0.05$) on human endothelial cells, as determined by immunofluorescence.

These data demonstrate that IL-1 beta has a positive regulatory role in adhesion molecule expression on monocytes and endothelial cells. The effect of IL-1 beta on monocyte adhesion to IL-1 beta-activated endothelium was investigated using a monocyte attachment assay. Preincubation of IL-1 beta-activated endothelial cells with IL-1 receptor antagonist (
